Message Transfer Agent Background

The message Transfer Agent (MTA) is responsible for managing messages that must be transferred to or from a non-local e-mail server.

This includes other Exchange servers and non-Exchange e-mail servers (Lotus Notes, SMTP, cc:Mail, etc.). The MTA also manages distribution lists for messages.

MTA queue lengths provide a general indication of Exchange performance. In general, on a well configured Exchange server, the queues will be close to 0. On a system exceeding its capacities, the queue will approach 2. Should a queue length regularly exceed 2, the system will be perceptibly slow.

While high queue times may indicate a problem with Exchange, a backlog of messages on the MTA may actually be an indication of a problem elsewhere in the system. Typically, these other problems include connectivity problems with other servers, including the following:

- There may be network problems prohibiting data transfer.
- There may be network security issues (site connectors between two domains with different service accounts).
- Other Exchange systems may be shut down or their Exchange services may be stopped.

An additional factor that affects MTA performance is the amount of external mail being processed by the server. Because Exchange handles internal mail (mail sent to a recipient on the same server) more efficiently and faster than external mail, high levels of external mail increase the amount of MTA-dependent processes.

Analysis

Our analysis of the Message Transfer Agent consisted of examining the lengths of <Name Field> MTA queues and the periods of peak MTA queue length.

Selected Data

Graph 1 - MTA Work Queue Length. The MTA Queue Length is the one-hour average number of outstanding messages in the MTA queue that had not been processed to completion. The High Queue Length represents the highest value monitored during each hour. This counter provides an overall health rating for the MTA.

DATE	END TIME OF ONE-HOUR PERIOD IN WHICH PEAK VALUE OCCURRED:	PEAK GRAPH LENGTH
10/13/00	6:00 PM	250.7
10/14/00	2:00 PM	820.5
10/14/00	3:00 PM	1066.9
10/15/00	3:00 PM	95.1
10/15/00	4:00 PM	401.9
10/15/00	5:00 PM	448.9
10/18/00	5:00 PM	72.3
10/19/00	3:00 PM	172.1

610E { **Findings and Recommendations regarding the Message Transfer Agent**

During the monitored period, one or more significant peaks occurred in the MTA work queue. The likely source of these peaks is a communication problem between the MTA and another Exchange component on this server, a connector, or a remote Exchange MTA.

610F { Recommended actions are to (1) Verify that all servers with large backlogged MTA queues bound for them are accessible over the network. (2) Verify that all Exchange services, including the MTA, are up and running on all servers in the organization. (3) Check the application event log in chapter 6 for additional information on specific errors.
